

Maximum Overdrive

Controller operation

Manual Mode (rocker switch in down (off) position):

In manual mode the red LED is off, the green LED will illuminate at approximately 25 MPH indicating that the minimum speed has been reached. Once the green LED is on, the overdrive can be engaged by depressing the foot switch. The overdrive can be disengaged by depressing the foot switch again.

If the vehicle speed drops below the 25 MPH minimum speed, the green LED will turn off and the overdrive will disengage automatically. Once the vehicle speed increases above the 25 MPH minimum speed (Green LED illuminated) the overdrive is again operational by depressing the foot switch.

Note: *If the overdrive is engaged and the speed drops below the 25 MPH minimum speed (which will disengage the overdrive), the overdrive will NOT re-engage automatically once the speed increases to 25 MPH.*

Automatic Mode (rocker switch in up (on) position):

In auto mode, the red LED is on and the green LED is off.

When the vehicles speed reaches approximately 48 MPH, the overdrive will automatically engage. When the vehicles speed drops below approximately 30 MPH the overdrive will automatically disengage.
